(57) **ABSTRACT**

To display a horizontally oblong movie on a vertically
oblong display portion, the movie may be displayed with
being rotated 90 degrees by a CPU while the display portion
is held in an orientation where the display portion is wider
than tall. Since this arrangement puts a heavy load on the
CPU, the mobile terminal according to the invention is
adapted to implement the movie rotation by processings in
the display portion. More specifically, an image memory in
the display portion has a foursquare figure each side of
which has a length the same as a longer side of a display
panel of the display portion. A picture data is written on the
memory in the same direction as a direction in which the
picture data is read out to be transferred to the panel by the
driver portion, and the driver portion rotates the picture data
when transferring it.
